

LAB 11 Measurement of k

Part A: Calibration

0.0025 M/L \rightarrow 25 M/mL add 96 mL DI

λ_{max}

Absorbance

$0.05 \leq A \leq 1.5$

1 480.1 .08

2 480.1 .150

3 489.4 .200

4 489.2 .316

5 489.2 .431

\rightarrow Concentration
 $A = \epsilon l C + b$

$\epsilon = 8600$

I	3.57e-4	3.57e-4	0
C	-x	-x	+x
E	3.41e-4	3.41e-4	1.57e-5

Part B:

Solution

λ_{max} (nm)

Absorbance

6 466.4 .114

7 469.8 .222

8 466.4 .279

9 461.9 .305

10 464.2 .375

11 460.0 .295

12 462.2 .411

13 460.7 .497

14 460.7 .629

15 458.5 .733

$x = 1.57e-5 M$

$.114 = 8600 C - .021$

$C = \frac{.114 + .021}{8600}$

$1.57e-5$

$k_b = \frac{1.57e-5}{(3.41e-4)^2}$

$= 134.65$

\rightarrow GUP Attenuation: As concentration $[Fe(SCN)_2]$ increases,

The Absorbance follows same. Relatively to k , since

Both the Product + Reactant concentration increase

@ Constant Rate, The k remains constant + Thus

For k It remains unaffected
